# WWW Lifecycle

As we know it, the Internet being an entire network, connections, a global system that permits, under usage of a suite of protocols, to interconnect computer networks.

That connections have a cycle of events, in order to being able to change information.

The picture above, represents www lifecycle, being mentioned in a few simple steps that permit that change of data.

Describing the picture, the lifecycle implies a device with an operate system, connected to the internet and based on a request-response protocol, the user can acces the data he needs.

Using an open internet browser, the user sends a request to DNS (who converts the name into IP) and based on that IP, the browser sends an HTTP request (by GET method) to the server.

The web server, returns data (as text – HTML document) to the user, through the browser, in order to display the web page.
